

Trigonometric Ratios of Compound Angles

An angle made up of the algebraic sum of two or more angles is called a compound angle. Some of the formulae and results regarding compound angles are:

$$\sin(A + B) = \sin A \cos B + \cos A \sin B$$

$$\sin(A - B) = \sin A \cos B - \cos A \sin B$$

$$\cos(A + B) = \cos A \cos B - \sin A \sin B$$

$$\cos(A - B) = \cos A \cos B + \sin A \sin B$$

$$\tan(A + B) = \frac{\tan A + \tan B}{1 - \tan A \tan B}$$

$$\tan(A - B) = \frac{\tan A - \tan B}{1 + \tan A \tan B}$$

$$\sin(A + B) \sin(A - B) = \sin^2 A - \sin^2 B = \cos^2 B - \cos^2 A.$$

$$\cos(A + B) \cos(A - B) = \cos^2 A - \sin^2 A - \sin^2 B = \cos^2 B - \sin^2 A.$$

Illustration:

Prove that $\tan 70^\circ = 2 \tan 50^\circ + \tan 20^\circ$.

Solution:

$$\tan 70^\circ = \tan(50^\circ + 20^\circ)$$

$$= \frac{\tan 50^\circ + \tan 20^\circ}{1 - \tan 50^\circ \tan 20^\circ}$$

$$\text{or, } \tan 70^\circ (1 - \tan 50^\circ \tan 20^\circ) = \tan 50^\circ + \tan 20^\circ$$

$$\text{or, } \tan 70^\circ = \frac{\tan 50^\circ + \tan 20^\circ}{1 - \tan 50^\circ \tan 20^\circ}$$

$$= \frac{\cot 20^\circ \tan 50^\circ \tan 20^\circ + \tan 50^\circ + \tan 20^\circ}{1 - \tan 50^\circ \tan 20^\circ}$$

$$= 2 \tan 50^\circ + \tan 20^\circ.$$

Illustration:

If $A + B = 45^\circ$, show that $(1 + \tan A)(1 + \tan B) = 2$.

Solution:

$$\tan(A + B) = \frac{\tan A + \tan B}{1 - \tan A \tan B} = 1$$

$$\tan A + \tan B + \tan A \tan B + 1 = 1 + 1$$

$$\tan A (1 + \tan B) + (1 + \tan B) = 2$$

$$(1 + \tan A)(1 + \tan B) = 2$$

Trigonometric Ratios of Multiples of an Angle

$$\sin 2A = 2 \sin A \cos A = \frac{2 \tan A}{1 + \tan^2 A}$$

$$\cos 2A = \cos^2 A - \sin^2 A = \frac{1 - \tan^2 A}{1 + \tan^2 A}$$

$$\tan 2A = \frac{2 \tan A}{1 - \tan^2 A}$$

$$\sin 3A = 3 \sin A - 4 \sin^3 A = 4 \sin(60^\circ - A) \sin A \sin(60^\circ + A)$$

$$\cos 3A = 4 \cos^3 A - 3 \cos A = 4 \cos(60^\circ - A) \cos A \cos(60^\circ + A)$$

$$\tan 3A = \frac{3 \tan A - \tan^3 A}{1 - 3 \tan^2 A} = \tan(60^\circ - A) \tan A \tan(60^\circ + A)$$

Illustration:

Find the values of (i) $\sin 18^\circ$ (ii) $\tan 15^\circ$

Solution:

(i) $\sin 18^\circ$

$$\text{Let } \theta = 18^\circ \text{ then } 2\theta = 36^\circ = 90^\circ - 3\theta.$$

$$\text{Now } \sin 2\theta = 2 \sin \theta \cos \theta \text{ and}$$

$$\sin(90^\circ - 3\theta) = \cos^3 \theta = 4 \cos^3 \theta - 3 \cos \theta$$

$$\text{Hence we have } 2 \sin \theta \cos \theta = \cos \theta (4 \cos^2 \theta - 3) = \cos \theta (1 - 4 \sin^2 \theta).$$

$$\text{Hence, } 2 \sin \theta = 1 - 4 \sin^2 \theta \text{ (as } \cos \theta \neq 0)$$

$$4 \sin^2 \theta + 2 \sin \theta - 1 = 0 \quad \sin \theta = \frac{-2 \pm \sqrt{4 + 16}}{2 \cdot 4} = \frac{-1 \pm \sqrt{5}}{4}$$

$$\text{But as } \sin \theta > 0 \text{ we have } \sin \theta = \frac{\sqrt{5} - 1}{4} \text{ i.e. } \sin 18^\circ = \frac{\sqrt{5} - 1}{4}$$

(ii) $\tan 15^\circ$

$$\tan 15^\circ = \tan(60^\circ - 45^\circ) = \frac{\sqrt{3} - 1}{1 + \sqrt{3}} = \frac{(\sqrt{3} - 1)^2}{3 - 1} = \frac{4 - 2\sqrt{3}}{2} = 2 - \sqrt{3}.$$

Sum of sines/cosines in Terms of Products

$$\sin A + \sin B = 2 \sin \frac{A+B}{2} \cos \frac{A-B}{2}$$

$$\sin A - \sin B = 2 \sin \frac{A-B}{2} \cos \frac{A+B}{2}$$

$$\cos A + \cos B = 2 \cos \frac{A+B}{2} \cos \frac{A-B}{2}$$

$$\cos A - \cos B = -2 \sin \frac{A+B}{2} \sin \frac{A-B}{2} \text{ (here notice } (B-A) \text{)}$$

$$\tan A + \tan B = \frac{\sin(A+B)}{\cos A \cos B}$$

Conversely

$$2 \sin A \cos B = \sin(A+B) + \sin(A-B)$$

$$2 \cos A \sin B = \sin(A+B) - \sin(A-B)$$

$$2 \cos A \cos B = \cos(A+B) + \cos(A-B)$$

$$2 \sin A \sin B = \cos(A-B) - \cos(A+B)$$

Illustration:

If α, β and γ are in A.P., show that $\cot \beta = \frac{\sin \alpha - \sin \gamma}{\cos \gamma - \cos \alpha}$.

Solution:

Since α, β and γ are in A.P., $2\beta = \alpha + \gamma$ $\cot \beta = \frac{\alpha + \gamma}{2}$

$$= \frac{(\cos \alpha + \gamma/2)}{\sin \alpha + \gamma/2} = \frac{(2 \cos \alpha + \gamma/2 \sin \alpha + \gamma/2)}{2 \sin \alpha + \gamma/2 \sin \alpha + \gamma/2} = \frac{\sin \alpha - \sin \gamma}{\cos \gamma - \cos \alpha}.$$

Illustration:

Show that $\sin 12^\circ \sin 48^\circ \sin 54^\circ = 1/8$.

Solution:

$$\text{L.H.S.} = [\cos 36^\circ - \cos 60^\circ] \sin 54^\circ = 1/2 [\cos 36^\circ \sin 54^\circ - \sin 54^\circ]$$

$$= 1/4 [2 \cos 36^\circ \sin 54^\circ - \cos 54^\circ] = 1/4 [\sin 90^\circ + \sin 18^\circ - \sin 54^\circ]$$

$$= 1/4 [1 - (\sin 54^\circ - \cos 18^\circ)] = 1/4 [1 - 2 \sin 18^\circ \cos 36^\circ]$$

$$= 1/4 [1 - 2 \sin 18^\circ \cos 36^\circ] = 1/4 [1 - \sin 36^\circ \cos 36^\circ / \cos 18^\circ]$$

$$= 1/4 [1 - 2 \sin 36^\circ \cos 6^\circ / 2 \cos 18^\circ] = 1/4 [1 - \sin 72^\circ / 2 \sin 72^\circ] = 1/4 [1 - 1/2] = 1/8 = \text{R.H.S.}$$

Alternative Method

Let $\theta = 12^\circ$.

$$\text{L.H.S.} = 1/\sin 72^\circ \sin 12^\circ \sin 48^\circ \sin 72^\circ \sin 54^\circ$$

$$= 1/4 \sin 72^\circ \sin 12^\circ \sin 48^\circ \sin 72^\circ \sin 54^\circ$$

$$= 1/4 \sin 3(12^\circ) \sin 54^\circ / \sin 72^\circ = \sin 36^\circ \sin 54^\circ / 8 \sin 36^\circ \cos 36^\circ = 1/8 = \text{R.H.S.}$$
